Introduction

In Malawi, Africa and in the United States, many disabled individuals experience hardships that are more severe than the general public. Disabled Malawians and Americans experience lower employment rates and school attendance rates. Possible contributing factors could be discrimination, infrastructure, disability legislation, or the severity of the disability. We tested for discrimination by asking participants to rate medical school applicants, with one applicant in a wheelchair. We hypothesized that unfavorable perceptions would be placed upon the applicant pictured in a wheelchair in both countries.

Materials and Methods

Questionnaire 1: 52 participants were surveyed at UD and University of Livingstonia in Malawi. Participants were asked to rate applicant’s chance for success.

The American Applicants

Name: Frackson Gondowe  
Date of Birth: 9 October 1988  
Information: I was born near Blantryre and at the age of five I attended Manja Primary school. I am one of two brothers, and my father now lives in Lilongwe. When I was growing up I helped my father farm the grain from our fields. I advanced through primary school with good marks and was selected to Chickwawa Boys Secondary school. I found myself interested in technical drawing and considered becoming a builder. After completing several science experiments in the science lab I knew that Science was my strength. In my GCE, I scored A's in Biology and Chemistry. I hope to become a doctor so that I can make my father proud.

The Malawian Applicants

Questionnaire 2: Included 12 questions evaluating disability policy, infrastructure, discrimination in the employment sector, and knowledge of the origin of disabilities.

Discussion:

This experiment should be performed on a different population of people because college students are not representative of the overall population. Strong relationship between “access to education” and “quality of transportation” indicates a possible infrastructural barrier in Malawi. Strong correlation between “discrimination by employers” and “access to education” in U.S indicate possible discriminatory barriers.
