Morphometric skull analysis
Morphometrics seeks to quantify shapes for the purposes of comparison. Two morphometric problems are investigated. The first problem is the analysis of a head growth in children. The second problem is the spatiotemporal evolution of the longitudinal human skull shape. These problems are specified with a set of curves that represent the cranium shapes as they change over time, in the child’s head as it grows and in the skull as it evolves.

Rigid-body shape-changing mechanisms
A typical shape-change problem seeks a device that approximates a set of specified shapes with the edge geometries of some of its components.

Research objectives: This work investigates two morphometric problems by applying the theory of shape-changing rigid-body mechanisms. The advantage of approaching morphometrics in this way is that a modest number of physical parameters describes the changes between the curves.
