Fall Risk Assessment of Older Adults with Dementia Attending Goodwill Easter Seals Adult Day Services Programs

JAMIE WYNK
Advisor: Kurt Jackson PT, PhD, GCS

BACKGROUND AND PURPOSE

- Dementia is a neurocognitive disorder involving significantly impaired cognitive function. Alzheimer’s is the most common type of dementia.
- In 2015, estimated 5.3 million Americans with Alzheimer.
- In 2010, 31.7% of people 65 or older reported a fall with injury in the past year. These rates are even higher with dementia.
- Medical Cost of falls in 2013: $34 billion
- Purpose: To test different measures affecting fall risk (lower body strength, walking speed, balance) in order to better understand the possible needs of this population to develop targeted interventions.

METHODS

- Consent obtained
- History of past falls obtained from Goodwill/Easter Seals coordinators
- Measurements taken for Montreal Cognitive Assessment (MoCA), Timed Up and Go, 4 meter Walk test, Sit to Stand, and Grip Strength

PARTICIPANTS

- Inclusion Criteria:
  - Participants at Goodwill Easter Seals Adult Day Care services in the Miami Valley
  - Diagnosis of Alzheimer’s Disease or Dementia
  - Ability to walk at least 10 m without physical assistance
  - 19 Participants; 8 Males, 11 Females
  - Average Age: 72 years (Range: 64-86 years)
  - 7 used an assistive walking device (Rollator or cane)

RESULTS

</tbody>
</table>

Montreal Cognitive Assessment (30 pts):
- Participants Score = 16 (Range: 0-29)
- Average Score for individuals without dementia = 27.4
- Score of < 18 is cut-off between mild cognitive impairment and Alzheimer’s Disease.

- Gait Speed: 0.78 m/s (Range: 0.18-1.48 m/s)
- Age Matched Norms = 1.25 m/s

- Timed Up and Go: 15.67 sec (Range: 6.22-28.9 sec)
- Age Matched Norm = 9 sec
- Score of > 13.5 sec for Community Dwelling Adults signifies increased fall risk

- 30 Second Sit to Stand Test:
  - Participants = 8.13 repetitions (Range: 1.5-18 repetitions)
  - Age matched norms: Female 10-15, Male 12-17
  - Below 10-12 reps indicates an increased fall risk

- Grip Strength:
  - Males: 29 kg (range 15.6-37.6);
  - Age Norm: 42.4 kg
  - Grip strength < 37 kg predictive of decreased mobility
  - Females: 16.3 kg (range 9-22.3);
  - Age Norm: 23.7 kg
  - Grip strength < 21 kg predictive of decreased mobility

CONCLUSION

- Average MoCA scores were consistent with Alzheimer’s Disease
- Gait Speed, Timed Up and Go, Sit to Stands and Grip Strength were all lower than the normative values and indicative of an increased risk for falls and further loss of mobility.
- Individuals participating in Goodwill Easter Seals Adult Day Services would benefit from evidence based exercise programs of sufficient intensity and progression.
- Simple strengthening program of large anti-gravity muscle groups likely to have greatest chance for benefit.
